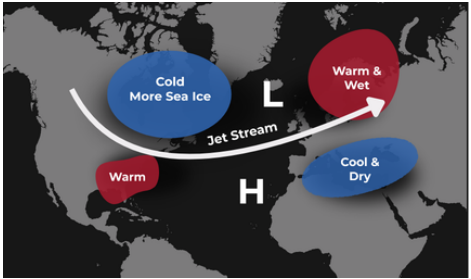
Abrupt Drought Termination in the British–Irish Isles Driven by High Atmospheric Vapour Transport

Parry et al. (2023), *Environmental Research Letters*

What's the Hypothesis?



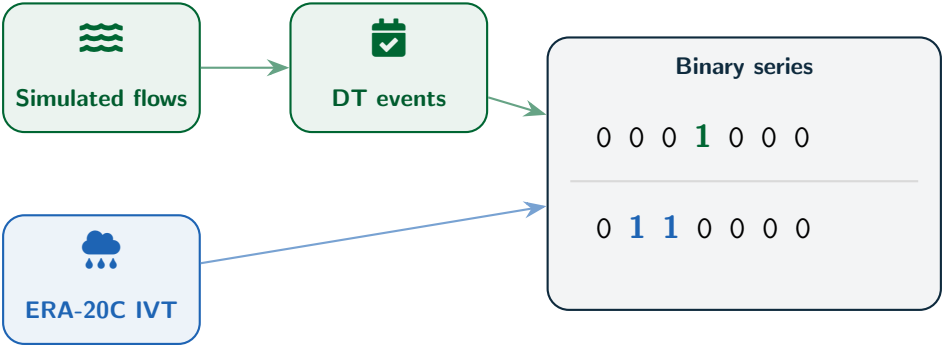
Adapted from Climate Data Canada

01 **NAO+ shifts jet stream over Ireland**

02 **Atmospheric rivers carry moisture**

03 **Uplift → heavy rainfall**

How Did They Test It?

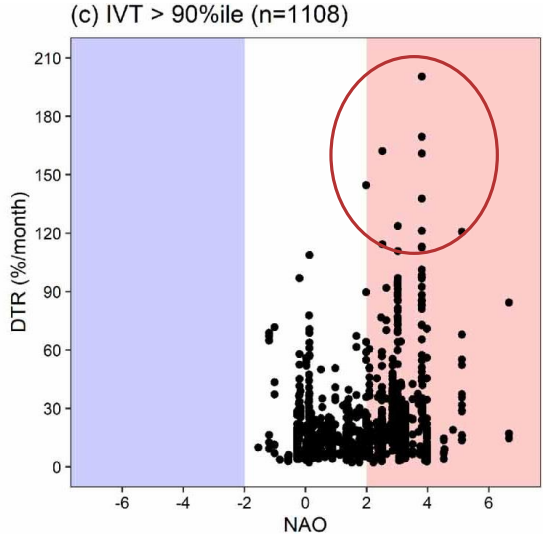


What Did They Find?

53% preceded by high IVT

Most abrupt: NAO+ + IVT

year-round



Conclusion

01 **Atmospheric rivers break droughts**

02 **Ireland responds year-round**

03 **Forecasting potential untested**
