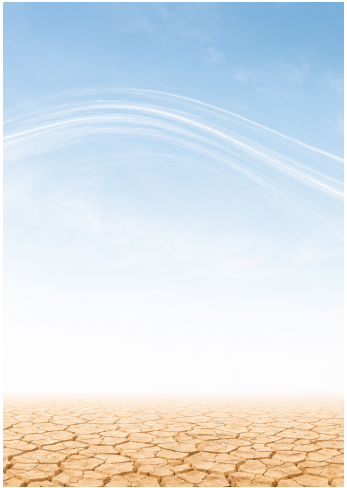
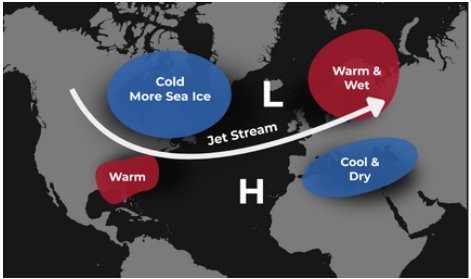
Abrupt Drought Termination in the British–Irish Isles Driven by High Atmospheric Vapour Transport

Parry et al. (2023), *Environmental Research Letters*



What's the Hypothesis?



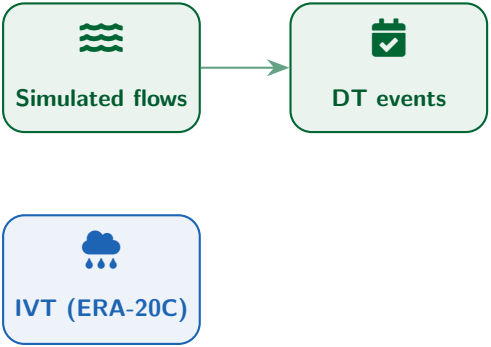
Adapted from Climate Data Canada

01 **NAO+ pushes jet stream south**

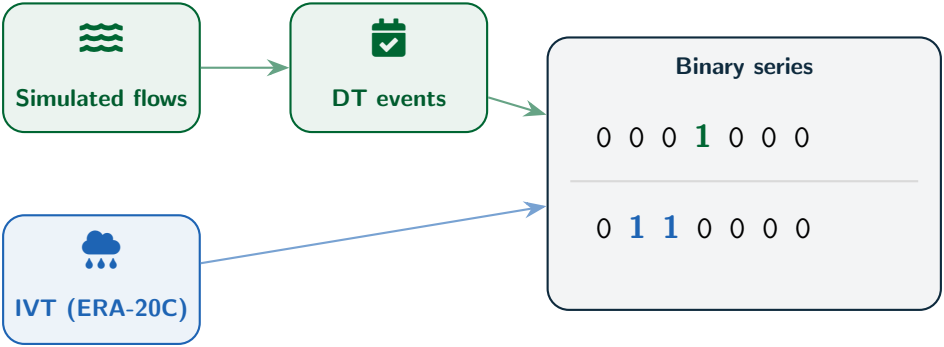
02 **Atmospheric rivers carry moisture**

03 **Uplift → heavy rainfall**

How Did They Test It?



How Did They Test It?



What Did They Find?

53% preceded by high IVT

What Did They Find?

53% preceded by high IVT

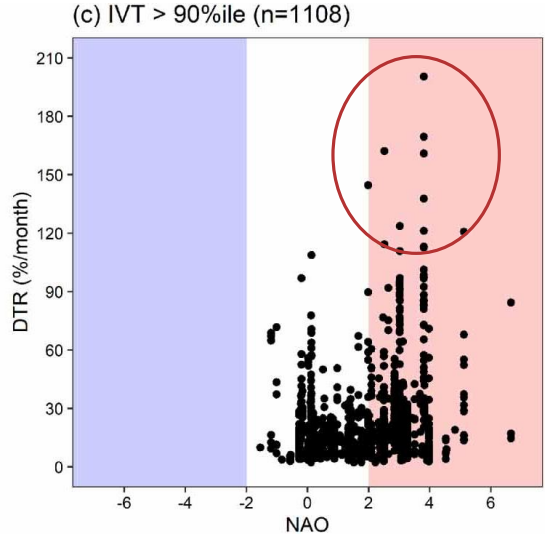
- **no seasonality**

What Did They Find?

53% preceded by high IVT

no seasonality

Most abrupt: NAO+ & IVT



Conclusion

01 **Atmospheric rivers drive drought termination**

02 **Abruptness, seasonality, region**

03 **Untapped potential**
